Why Should I Worry About UAV?

UAV can be controlled by hand-held radio transmitters, smart phones, or even GPS and are often outfitted with high-quality video or still cameras. The versatility of small-UAV makes them attractive to criminal and hostile actors. Potential uses for UAV include surveillance of potential targets, monitoring attacks for command and control, and the delivery of damaging or lethal payloads. UAV provide adversaries with the ability to circumvent traditional physical security measures such as gates and security guards. Exposed infrastructure systems (e.g., electrical transmission lines, bridges) and public gathering areas (outdoor special events) are vulnerable to UAV devices.

If you spot UAV on the installation, report to law enforcement authorities immediately.
